

NCA9547A

8-channel I²C-bus multiplexer with reset

Rev. 1 — 20 August 2025

Product data sheet

1. General description

The NCA9547A is an octal bidirectional translating multiplexer controlled by the I²C-bus. The SCL/SDA upstream pair fans out to eight downstream pairs, or channels. Only one SCn/SDn channel can be selected at a time, determined by the contents of the programmable control register. The device powers up with Channel 0 connected, allowing immediate communication between the controller and downstream devices (targets) on that channel.

An active LOW reset input allows the NCA9547A to recover from a situation where one of the downstream I²C-buses is stuck in a LOW state. Pulling the RESET pin LOW resets the I²C-bus state machine causing all the channels to be deselected, except Channel 0 so that the controller can regain control of the bus.

The pass gates of the multiplexers are constructed such that the V_{CC} pin can be used to limit the maximum high voltage which will be passed by the NCA9547A. This allows the use of different bus voltages on each pair, so that 1.8 V, 2.5 V, or 3.3 V parts can communicate with 5 V parts without any additional protection. External pull-up resistors pull the bus up to the desired voltage level for each channel. All I/O pins are 6 V tolerant.

2. Features and benefits

- 1-of-8 bidirectional translating multiplexers
- I²C-bus interface logic; compatible with SMBus standards
- Active LOW reset input
- Three address pins allowing up to eight devices on the I²C-bus
- Channel selection via I²C-bus, one channel at a time
- Power-up with all channels deselected, except channel 0 which is connected
- Low R_{on} multiplexers
- Allows voltage level translation between 1.8 V, 2.5 V, 3.3 V and 5 V buses
- No glitch on power-up
- Supports hot insertion
- Low standby current
- Operating power supply voltage range of 1.65 V to 5.5 V
- 6 V tolerant inputs
- 0 Hz to 400 kHz clock frequency
- Latch-up testing is done to JEDEC Standard JESD78 which exceeds 100 mA
- Two packages offered: TSSOP24, and HWQFN24
- ESD protection:
 - HBM: ANSI/ESDA/JEDEC JS-001 class 2 exceeds 2 kV
 - CDM: ANSI/ESDA/JEDEC JS-002 class C3 exceeds 1 kV
- Specified from -40 °C to +85 °C and from -40 °C to +125 °C

3. Ordering information

Table 1. Ordering information

Type number	Package			
	Temperature range	Name	Description	Version
NCA9547APW	-40 °C to +125 °C	TSSOP24	plastic thin shrink small outline package; 24 leads; body width 4.4 mm	SOT355-1
NCA9547ABY	-40 °C to +125 °C	HWQFN24	plastic thermal enhanced very very thin Quad Flat packages; no leads; 24 terminals; 0.5 mm pitch; 4 × 4 × 0.75 mm body	SOT8041-1

V _{CC}	24	21	supply voltage

- [1] HWQFN24 package die supply ground is connected to both the GND pin and the exposed center pad. The GND pin must be connected to supply ground for proper device operation. For enhanced thermal, electrical, and board-level performance, the exposed pad needs to be soldered to the board using a corresponding thermal pad on the board, and for proper heat conduction through the board thermal vias need to be incorporated in the PCB in the thermal pad region.

7. Functional description

Refer to [Fig. 2](#).

7.1. Device address

Following a START condition, the bus controller must output the address of the target it is accessing. The address of the NCA9547A is shown in [Fig. 5](#). To conserve power, no internal pull-up resistors are incorporated on the hardware selectable address pins and they must be pulled HIGH or LOW.

The last bit of the target address defines the operation to be performed. When set to logic 1 a read is selected, while a logic 0 selects a write operation.

7.2. Control register

Following the successful acknowledgement of the target address, the bus controller will send a byte to the NCA9547A, which will be stored in the control register. If multiple bytes are received by the NCA9547A, it will save the last byte received. This register can be written and read via the I²C-bus.

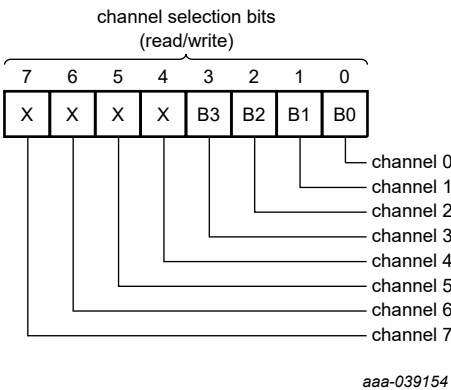

Fig. 6. Control register

7.2.1. Control register definition

One or several SCn/SDn downstream pair, or channel, is selected by the contents of the control register. This register is written after the NCA9547A has been addressed. The contents of the control byte are used to determine which channel is to be selected. The 4 LSBs of the control byte are used to determine which channel is to be selected. When a channel is selected, the channel will become active after a STOP condition has been placed on the I²C-bus. This ensures that all SCn/SDn lines will be in a HIGH state when the channel is made active, so that no false conditions are generated at the time of connection.

Table 4. Control register

X	X	X	X	1	1	1	1	channel7 enabled
0	0	0	0	1	0	0	0	channel0 enabled; power-up/resetdefault state

7.3. RESET input

The RESET input is an active LOW signal which may be used to recover from a bus fault condition. By asserting this signal LOW for a minimum of $t_{w(rst)L}$, the NCA9547A will reset its register and I²C-bus state machine and will deselect all channels except channel 0. The RESET input must be connected to V_{CC} through a pull-up resistor.

7.4. Power-on reset

When power is applied to V_{CC} , an internal Power-On Reset (POR) holds the NCA9547A in a reset condition until V_{CC} has reached V_{PORR} . At this point, the reset condition is released and the NCA9547A register and I²C-bus state machine are initialized to their default states, causing all the channels to be deselected except channel 0. Thereafter, V_{CC} must be lowered below 0.2 V for at least 5 μ s in order to reset the device.

7.5. Voltage translation

The pass gate transistors of the NCA9547A are constructed such that the V_{CC} voltage can be used to limit the maximum voltage that will be passed from one I²C-bus to another.

Fig. 7. Pass gate voltage versus supply voltage

Fig. 8. Pass gate voltage versus supply voltage

Fig. 7 shows the voltage characteristics of the pass gate transistors (note that the NCA9547A is only tested at the points specified in [Section 13](#) of this data sheet). In order for the NCA9547A to act as a voltage translator, the V_{pass} voltage should be equal to, or lower than the lowest bus voltage. For example, if the main bus was running at 5 V, and the downstream buses were 3.3 V and 2.7 V, then V_{pass} should be equal to or below 2.7 V to effectively clamp the downstream bus voltages. Looking at [Fig. 7](#), we see that $V_{pass(max)}$ will be at 2.7 V when the NCA9547A supply voltage is 3.5 V or lower, so the NCA9547A supply voltage could be set to 3.3 V. Pull-up resistors can then be used to bring the bus voltages to their appropriate levels (see [Fig. 15](#)).

8. Characteristics of the I²C-bus

The I²C-bus is for 2-way, 2-line communication between different ICs or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

8.1. Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as control signals (see Fig. 9).

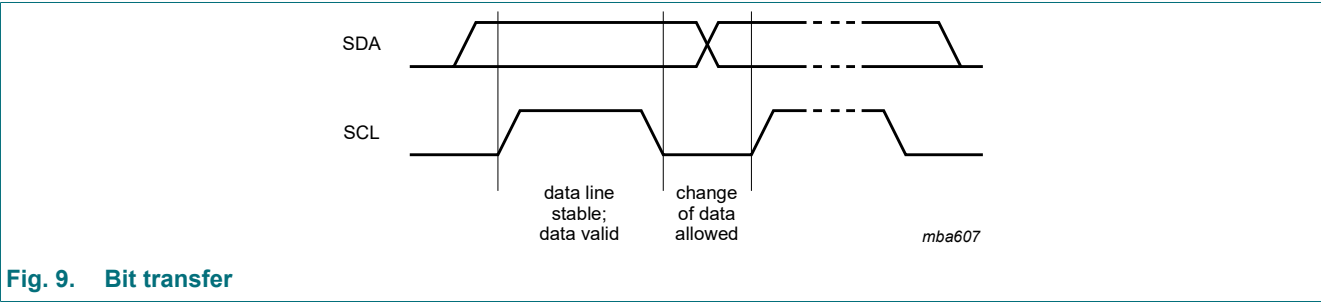

Fig. 9. Bit transfer

8.2. START and STOP conditions

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line while the clock is HIGH is defined as the START condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition (P) (see Fig. 10).

Fig. 10. Definition of START and STOP conditions

8.3. System configuration

A device generating a message is a 'transmitter', a device receiving is the 'receiver'. The device that controls the message is the 'controller' and the devices which are controlled by the controller are the 'targets' (see Fig. 11).

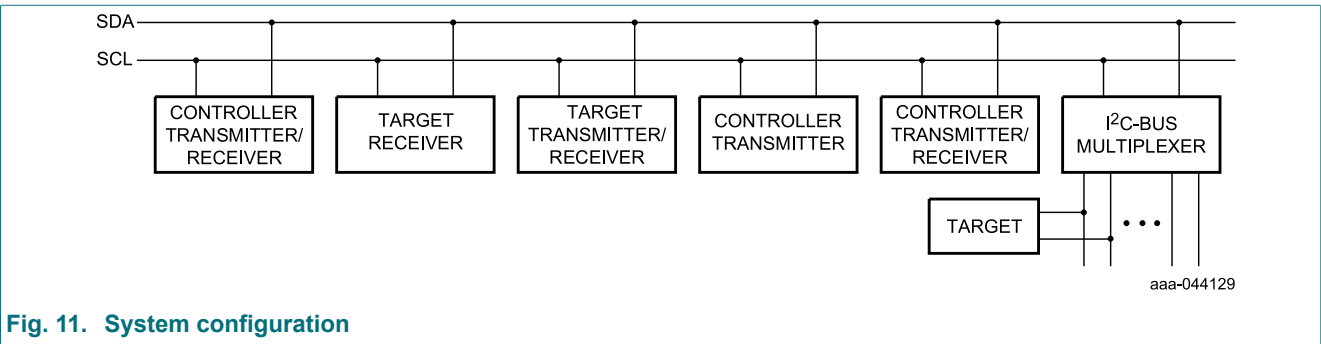

Fig. 11. System configuration

8.4. Acknowledge

The number of data bytes transferred between the START and the STOP conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one acknowledge bit. The acknowledge bit is a HIGH level put on the bus by the transmitter, whereas the controller generates an extra acknowledge related clock pulse.

A target receiver which is addressed must generate an acknowledge after the reception of each byte. Also, a controller must generate an acknowledge after the reception of each byte that has been clocked out of the target transmitter. The device that acknowledges has to pull-down the SDA line during the acknowledge clock pulse so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse; set-up and hold times must be taken into account.

A controller receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the target. In this event, the transmitter must leave the data line HIGH to enable the controller to generate a STOP condition.

Fig. 12. Acknowledgement on the I²C-bus

8.5. Bus transactions

Data is transmitted to the NCA9547A control register using the Write mode as shown in Fig. 13.

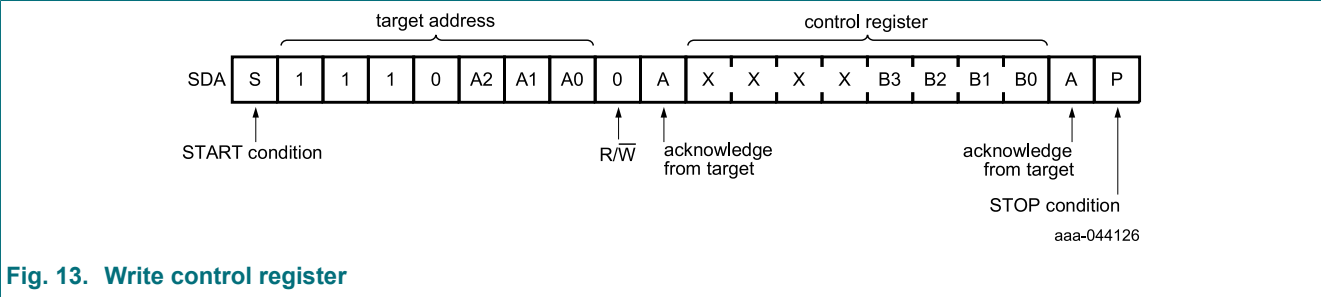

Fig. 13. Write control register

Data is read from NCA9547A using the Read mode as shown in Fig. 14.

[1] All typical values are measured at T_{amb} = 25 °C.

14. Dynamic characteristics

Table 9. Dynamic characteristics

At recommended operating conditions. Voltages are referenced to ground (GND = 0 V).

Symbol	Parameter	Conditions	Standard-mode I ² C-bus		Fast-mode I ² C-bus		Unit
			Min	Max	Min	Max	
t _{PD}	propagation delay	from SDA to SDx, [1] or SCL to SCx	-	0.3	-	0.3	ns
f _{SCL}	SCL clock frequency		0	100	0	400	kHz
t _{BUF}	bus free time between a STOP and START condition		4.7	-	1.3	-	μs
t _{HD;STA}	hold time (repeated) START condition	[2]	4.0	-	0.6	-	μs
t _{LOW}	LOW period of the SCL clock		4.7	-	1.3	-	μs
t _{HIGH}	HIGH period of the SCL clock		4.0	-	0.6	-	μs
t _{SU;STA}	set-up time for a repeated START condition		4.7	-	0.6	-	μs
t _{SU;STO}	set-up time for STOP condition		4.0	-	0.6	-	μs
t _{HD;DAT}	data hold time		0 [3]	[4]	0 [3]	[4]	μs
t _{SU;DAT}	data set-up time		250	-	100	-	ns
t _r	rise time of both SDA and SCL signals		-	1000	20 + 0.1C _b [5]	300	ns
t _f	fall time of both SDA and SCL signals		-	300	20 + 0.1C _b [5]	300	ns
C _b	capacitive load for each bus line		-	400	-	400	pF
t _{SP}	pulse width of spikes that must be suppressed by the input filter		-	50	-	50	ns
t _{VD;DAT}	data valid time	HIGH-to-LOW [6]	-	1	-	1	μs
		LOW-to-HIGH [6]	-	0.6	-	0.6	μs
t _{VD;ACK}	data valid acknowledge time		-	1	-	1	μs
RESET							
t _{w(rst)L}	LOW-level reset time		4	-	4	-	ns
t _{rst}	reset time	SDA clear	-	500	-	500	ns
t _{REC;STA}	recovery time to START condition		0	-	0	-	ns

[1] Pass gate propagation delay is calculated from the 20 Ω typical R_{on} and the 15 pF load capacitance.

[2] After this period, the first clock pulse is generated.

[3] A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IH(min)} of the SCL signal) in order to bridge the undefined region of the falling edge of SCL.

[4] The maximum t_{HD;DAT} could be 3.45 μs and 0.9 μs for Standard-mode and Fast-mode, but must be less than the maximum of t_{VD;DAT} or t_{VD;ACK} by a transition time. This maximum must only be met if the device does not stretch the LOW period (t_{LOW}) of the SCL signal. If the clock stretches the SCL, the data must be valid by the set-up time before it releases the clock.

[5] C_b = total capacitance of one bus line in pF.

[6] Measurements taken with 1 kΩ pull-up resistor and 50 pF load.

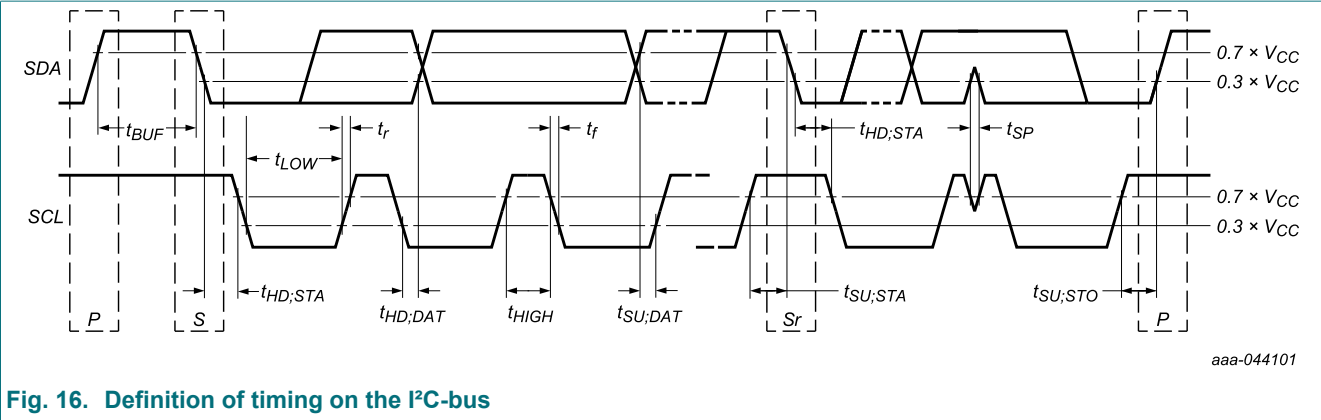

Fig. 16. Definition of timing on the I²C-bus

Fig. 17. Definition of RESET timing

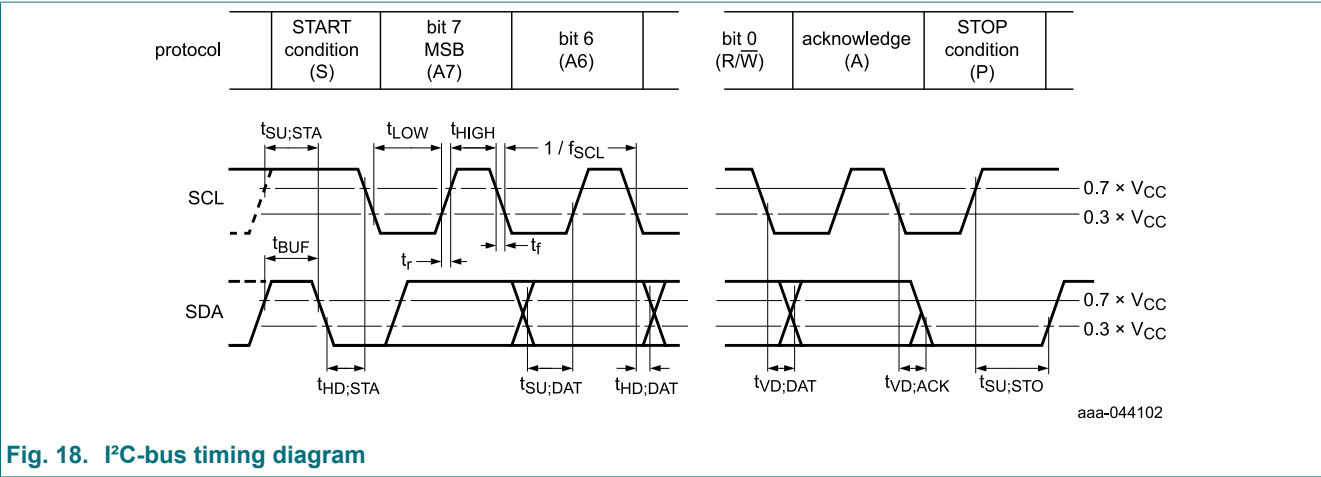

Fig. 18. I²C-bus timing diagram

15. Power-on reset requirements

In the event of a glitch or data corruption, NCA9547A can be reset to its default conditions by using the power-on reset feature. Power-on reset requires that the device go through a power cycle to be completely reset. This reset also happens when the device is powered on for the first time in an application. The power-on reset feature is shown in Fig. 19.

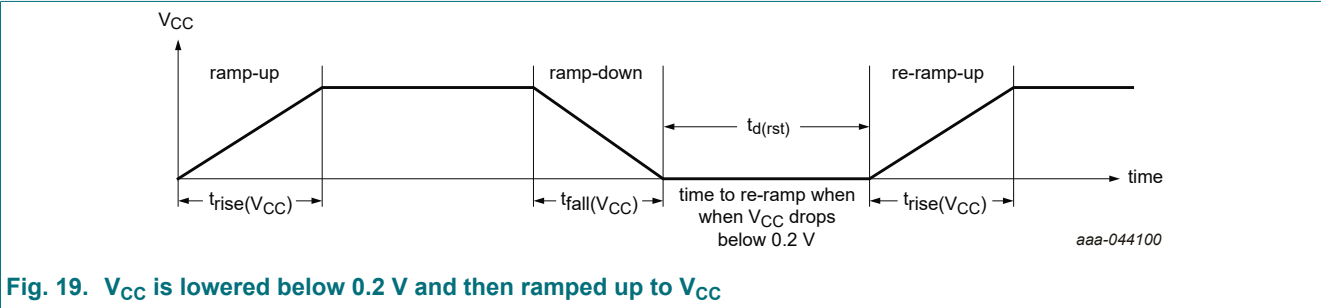

Fig. 19. V_{CC} is lowered below 0.2 V and then ramped up to V_{CC}

Table 10 specifies the performance of the power-on reset feature for NCA9547A.

Table 10. Recommended supply sequencing and ramp rates
T_{amb} = 25 °C (unless otherwise noted). Not tested; specified by design.

Symbol	Parameter	Condition	T _{amb} = 25 °C			Unit
			Min	Typ	Max	
$t_{rise}(V_{CC})$	supply rise time	see Fig. 19	0.1	-	100	ms
$t_{fall}(V_{CC})$	supply fall time	see Fig. 19	1	-	100	ms
$t_{d(rst)}$	reset delay time	see Fig. 19	5	-	-	µs
$V_{CC(gl)}$	minimum glitch supply voltage	level that V _{CC} can glitch down to with a ramp rate of 0.4 µs/V, but not cause a functional disruption when $t_{w(gl)}V_{CC} < 1 \mu s$; see Fig. 20	-	-	1.2	V
$t_{w(gl)}V_{CC}$	supply voltage glitch pulse width	glitch width that will not cause a functional disruption when $V_{CC(gl)} = 0.5 \times V_{CC}$; see Fig. 20	-	-	10	µs

Glitches in the power supply can also affect the power-on reset performance of this device. The glitch width ($t_{w(gl)}V_{CC}$) and glitch level ($V_{CC(gl)}$) are dependent on each other. The bypass capacitance, source impedance, and device impedance are factors that affect power-on reset performance. Fig. 20 and Table 10 provide more information on how to measure these specifications.

Notwithstanding any damages that customer might incur for any reason whatsoever, Nexperia's aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of Nexperia.

Right to make changes — Nexperia reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — Nexperia products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an Nexperia product can reasonably be expected to result in personal

injury, death or severe property or environmental damage. Nexperia and its suppliers accept no liability for inclusion and/or use of Nexperia products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. Nexperia makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using Nexperia products, and Nexperia accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the Nexperia product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

Nexperia does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using Nexperia products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). Nexperia does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — Nexperia products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nexperia.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. Nexperia hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of Nexperia products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific Nexperia product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. Nexperia accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without Nexperia's warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond Nexperia's specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies Nexperia for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond Nexperia's standard warranty and Nexperia's product specifications.

Translations — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.
